

Make Windows Run Disk Cleanup Automatically with Task Scheduler

Running Disk Cleanup regularly in Windows is an integral part of keeping your system running smoothly. So let's do it.

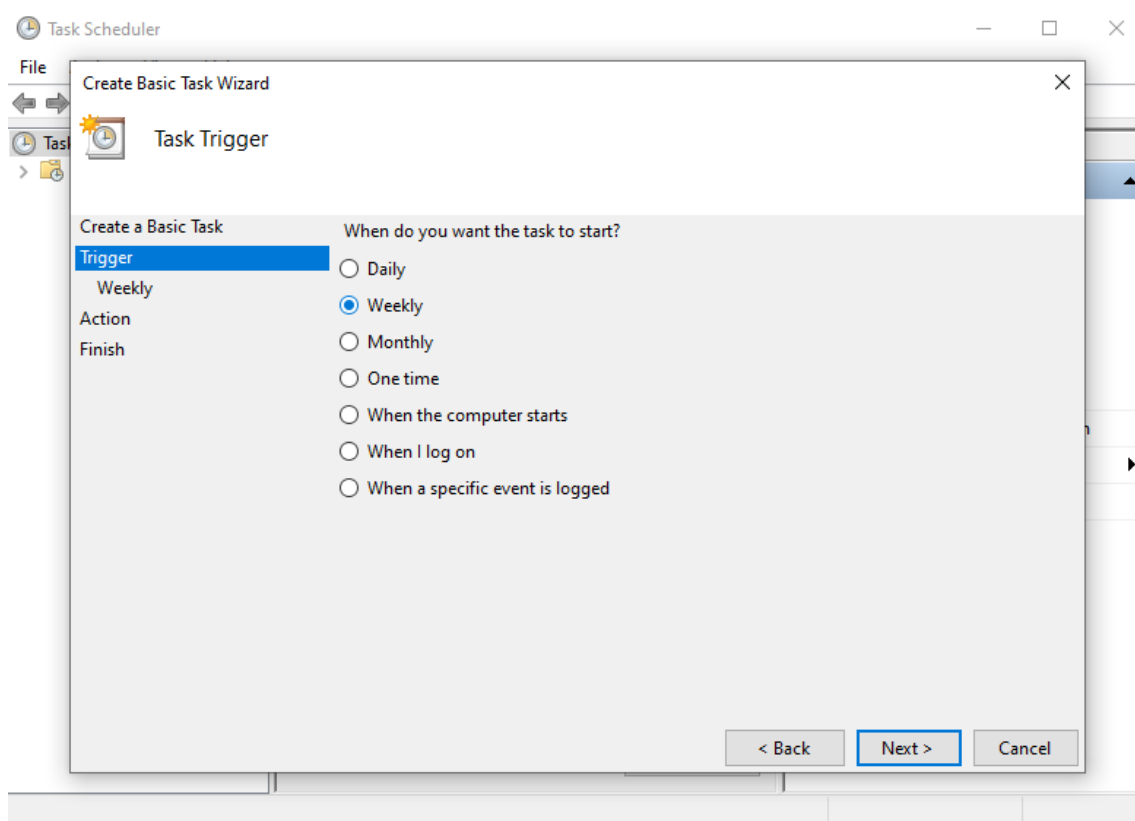

1. Open Task Scheduler from the Administrative Tools folder.

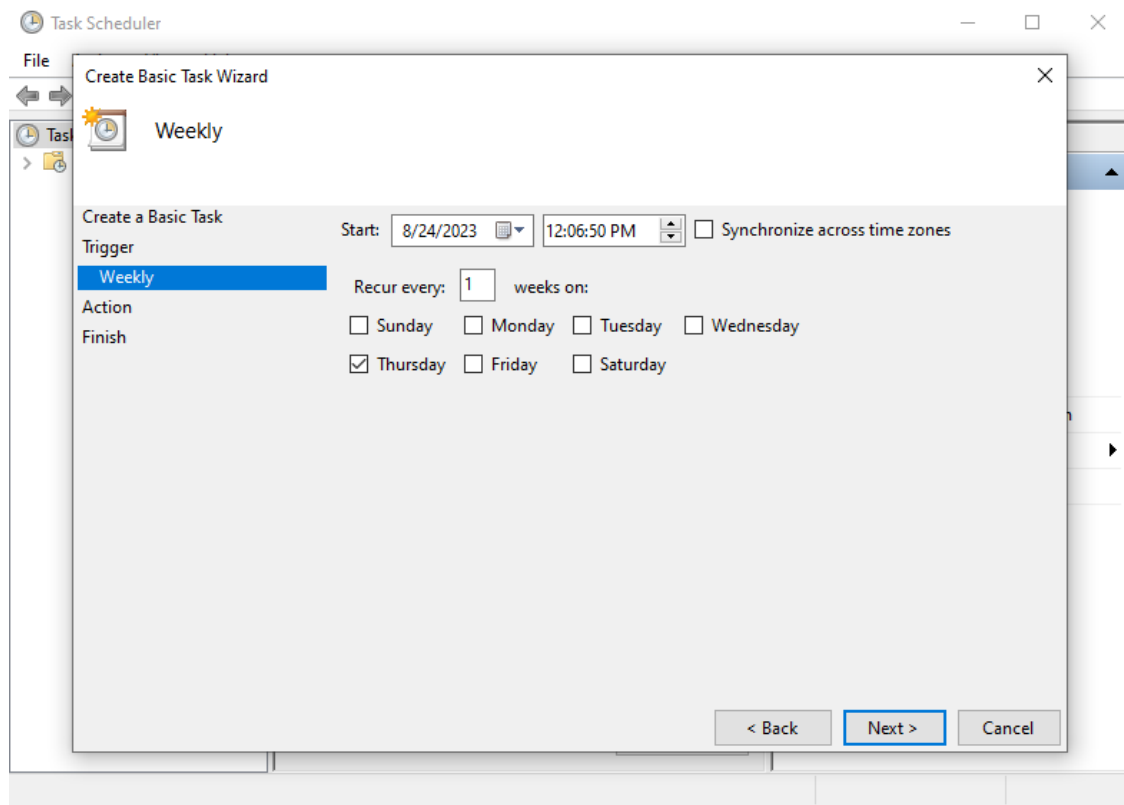

2. In the Task Scheduler window, click on "Create Basic Task."
3. Give the task a name and description. Click "Next."

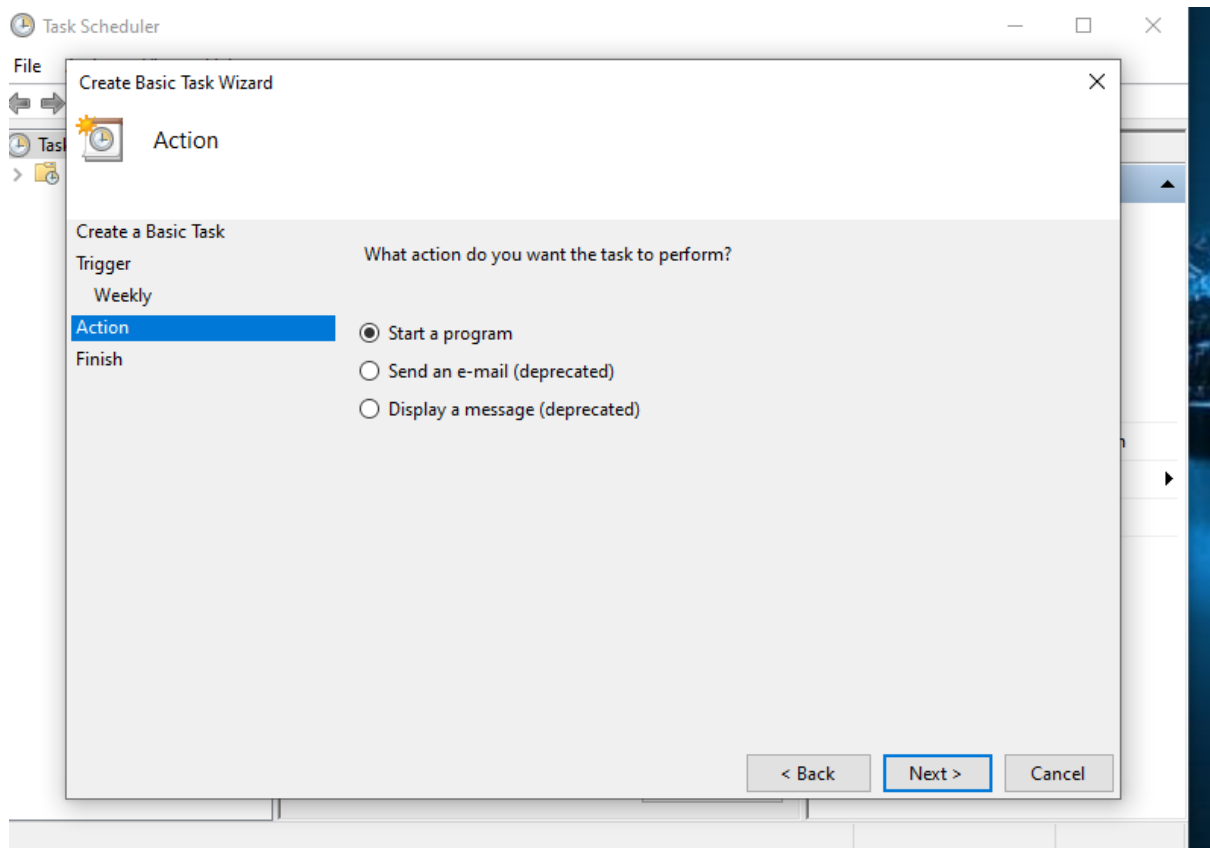

4. Select the option that best suits your needs. I used weekly option, then click "Next"

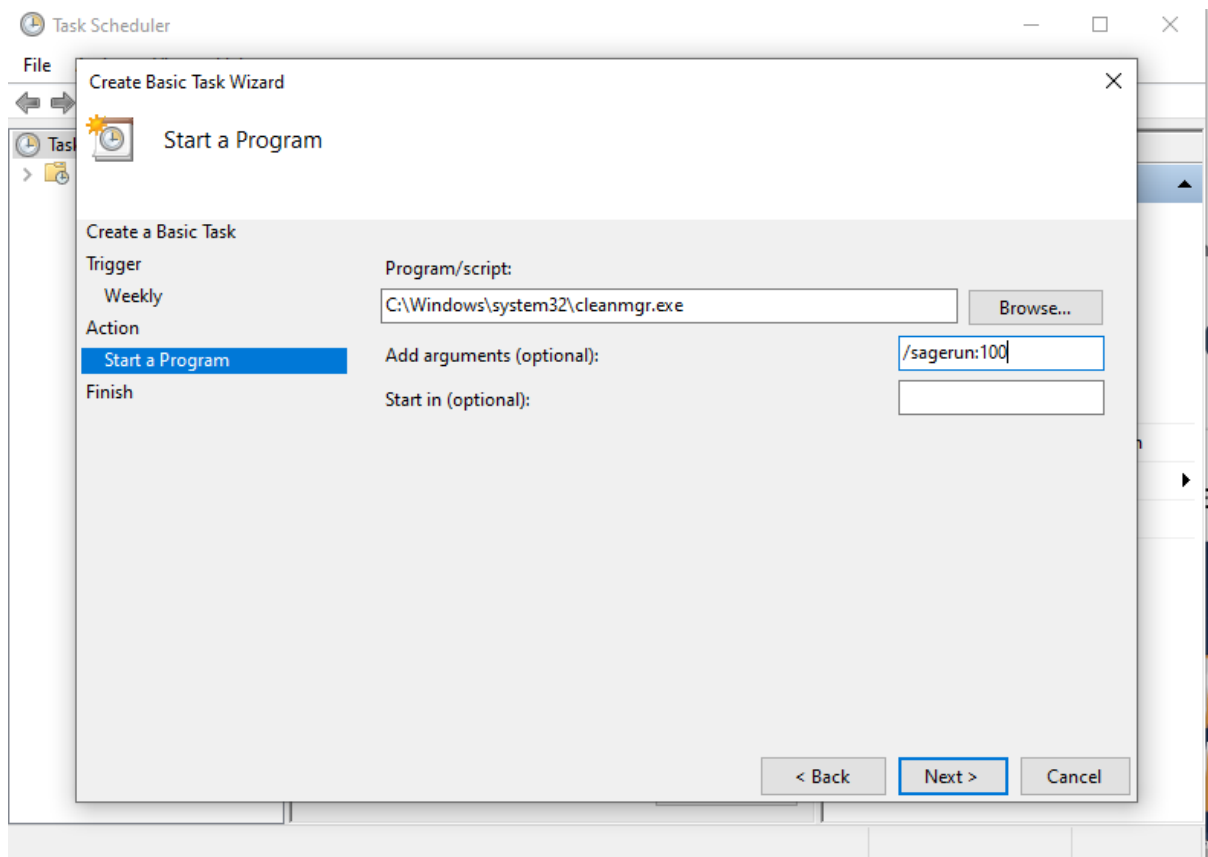

5. Select when you'd like to run the task. I chose the first Thursday of each week(once a week). Click "Next."

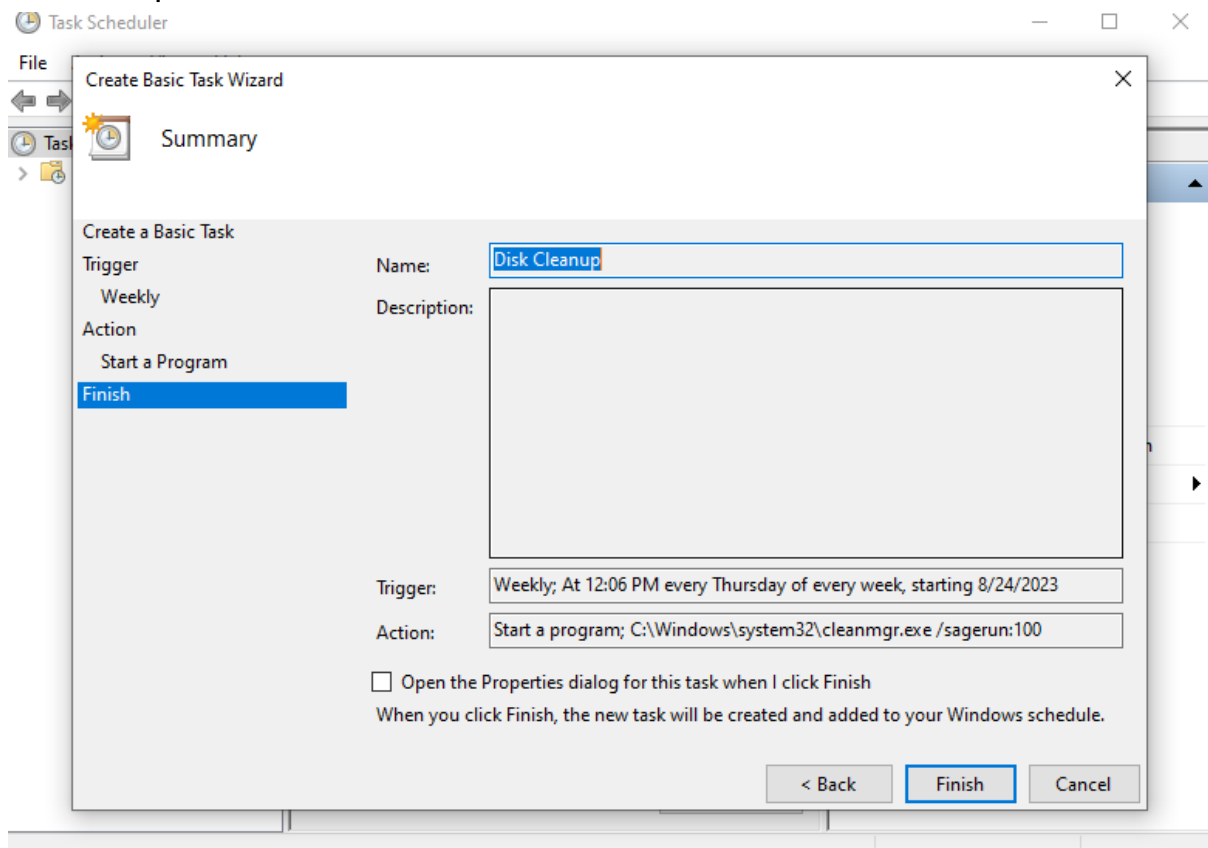

6. Now we need to give our task an action to execute. I chose "Start a program." Click "Next."

7. choose your path of cleanmgr .Add argument as : `/sagerun:100` then Click “Next.”

8. To complete the creation of our task, click “Finish.”

Now, either wait for the time of the task to arrive, or, if you want to check if it works right now, find it in the scheduled tasks library, right-click it, and select “Run.” If it runs, you’ll see it, and you can also check the last run status.
